- 1/2" to 8" Rock Removal
- 10 GPM Hydraulic Flow Required
- Low Profile/Low Maintenance Design

- Made In The USA
- Hardox 450 Steel Rotor Teeth
- Available With Solid Or Screening Collection Bucket

## Rock Removal / Soil Preparation

Rockaway landscape rakes remove 1/2" to 8" rocks every time. While you are removing rocks with our rock rakes you'll also be preparing the soil for new seed or sod. The porting on the front of the hood allows dirt to filter out and conditions it for the next step.

## Fewer Moving Parts / Fewer Problems

Rockaways operate off of a single #80 chain that is protected by a durable chain guard. The chain turns the single rotor that is equipped with two sets of spiraled teeth. With fewer moving parts you will have fewer problems with breakdowns and operation.

## Low Profile Design

Rockaway rock rakes feature a low-profile design that makes it easier for the operator to see what they are doing. This makes the landscape rake easier to use and cuts down on accidents during operation.

## Durable Hardox 450 Steel Teeth

Each Rockaway is built with two sets of spiraled Hardox 450 steel teeth. The spiral pattern of the teeth draws rocks and debris into the center of the rock rake's path and into the bucket. The hardened steel teeth will last through many seasons of use. Each tooth is individually welded in place, this makes replacing a tooth easy if one breaks off.

**DURABLE. RUGGED. RELIABLE.**
